Core Functions

A core function provides a GAAP-independent function for determining / calculating one or more results.

One or more components are used here.

Which components are used to determine a result variable in the component-based approach is described in blueprints.

A result variable can be used "externally" or "internally".

For example,

- an evaluation result can be transferred to an external system (e.g. accounting system)
- the cash flow plan can be provided internally for the core function "valuation".

The following Core Functions are supported:

- Core Cash Flow Generation
- Core Valuation
- Core Data Mart
- Core Reports
- Data Quality
